# NATIONAL UNIVERSITY OF MODERN LANGUAGES

## Artificial Intelligence Lab Report No - 2

**NAME: M Abdul Rafay**

**ROLL NO:** FL23791

**PROGRAM:** BSSE ($6^{th}$ Semester)

**COURSE:** Artificial Intelligence

**SUBMITTED TO:** Mam Amna Sajjad

**DATE: 22 Feb 2026** **DAY: Sunday**

# Lab Tasks - Application of if-elif-else Statements

**Lab Task 1: ATM Withdrawal Validation**

**Problem Context**

A bank ATM system must validate withdrawal conditions before processing a transaction.

**Task Description**

The system asks the user to enter:

- Account balance
- Withdrawal amount

The program applies the following rules:

- If withdrawal amount > 25,000 → Display **"Daily limit exceeded"**
- If withdrawal amount > account balance → Display **"Insufficient funds"**
- If withdrawal amount ≤ account balance → Display **"Transaction successful"**

**Code and Output**

```
[1]
20s
print("=== ATM Withdrawal System ===")

balance = float(input("Enter your account balance: "))
amount = float(input("Enter withdrawal amount: "))

if amount > 25000:
    print("Daily limit exceeded")
elif amount > balance:
    print("Insufficient funds")
else:
    print("Transaction successful")
```

```
=== ATM Withdrawal System ===
Enter your account balance: 5000
Enter withdrawal amount: 2000
Transaction successful
```

**Lab Task 2: AI Chatbot Mood Detector**

**Problem Context**

An AI chatbot detects the user's mood from text input and responds accordingly.

**Task Description**

The chatbot asks:

**"How are you feeling today?"**

Based on the input:

- If input contains "happy" → Great to hear!
- If input contains "sad" → I'm here for you.
- If input contains "tired" → Get some rest.
- Otherwise → Hope you have a nice day!

**Code and Output**

```
[2]
6s
print("=== AI Mood Detector ===")

mood = input("How are you feeling today? ").lower()

if "happy" in mood:
    print("Great to hear!")
elif "sad" in mood:
    print("I'm here for you.")
elif "tired" in mood:
    print("Get some rest.")
else:
    print("Hope you have a nice day!")
```

```
=== AI Mood Detector ===
How are you feeling today? tired
Get some rest.
```

**Lab Task 3: Smart Weather Advisor**

**Problem Context**

A smart weather assistant provides advice based on temperature input.

**Task Description**

- If temperature > 35 → Stay hydrated & avoid sun
- If temperature between 20 and 35 → Pleasant weather
- If temperature < 20 → Wear warm clothes

**Code and Output**

[3]

```python
print("\n=== Smart Weather Advisor ===")

temperature = float(input("Enter temperature: "))

if temperature > 35:
    print("Stay hydrated & avoid sun")
elif 20 <= temperature <= 35:
    print("Pleasant weather")
else:
    print("Wear warm clothes")
```

```
=== Smart Weather Advisor ===
Enter temperature: 45
Stay hydrated & avoid sun
```
