

NATIONAL UNIVERSITY OF MODERN LANGUAGES

Software Construction And Development Final Project

NAME: M Abdul Rafay (FL23791)

Zohaib Ijaz (FL23811)

Nazish Khan (FL23843)

Zainab Fatima (SP23690)

PROGRAM: BSSE (5th Semester)

COURSE: Software Construction and Development

SUBMITTED TO: Sir Ahsan Arif

DATE: 9/21/2025

DAY: Sunday

Hospital Appointment Booking System

1. Objective

The main objective of the *Hospital Appointment Booking System* is to create a digital solution that simplifies the process of booking appointments between patients and doctors. The system aims to replace manual methods with a faster and more organized platform. It helps reduce long waiting times, avoid scheduling mistakes, and keep appointment records accurate and up to date. Patients can easily book, view, or cancel appointments, while doctors and administrators can manage their schedules more effectively.

This project also aims to apply core software development practices such as requirement analysis, UML design, clean coding standards, exception handling, and unit testing. The goal is to build a reliable, user-friendly, and efficient system that supports real hospital workflows.

2. Introduction

Hospitals often face difficulties when appointments are booked manually. Long queues, busy phone lines, and misplaced records create delays and confusion for both patients and staff. As the number of patients increases, handling appointments without a proper system becomes even more difficult and time-consuming. To overcome these issues, a computerized appointment system is needed.

The *Hospital Appointment Booking System* is designed to automate and simplify the entire appointment process. Patients can register, log in, search for doctors by their specialization, and book appointments at a suitable time. Doctors can view their daily schedules and update their availability, and administrators can manage doctor profiles and time slots whenever needed.

This system improves communication, reduces workload, and ensures that appointments are handled smoothly and accurately. By using proper software engineering techniques—such as UML diagrams, structured design.

3. Detailed Design

This section explains the detailed design of the *Hospital Appointment Booking System* using UML diagrams. These diagrams help visualize the structure of the system, the relationships between objects, and the interaction flow during different operations. Each diagram provides a different perspective of the system's internal behavior and supports a clear and organized implementation.

The following subsections include:

1. Use-Case Diagram
2. Object Diagram
3. Communication Diagram
4. Timing Diagram

Screenshots of each diagram are inserted below their respective descriptions.

3.1 Use-Case Diagram

The Use-Case Diagram describes the external interactions between the system and its users. It identifies the main actors of the system—**Patient**, **Doctor**, and **Admin**—and the actions they can perform.

This diagram helps outline the functional requirements of the system and shows how users interact

with the system to complete tasks such as booking appointments, managing doctor profiles, and viewing schedules.

3.2 Object Diagram

The Object Diagram shows a snapshot of the system at a specific moment in time. It presents actual instances of classes—such as **User (Patient)**, **Doctor**, **Admin**, and **Appointment (Oppointment)**—and displays how these objects are linked to each other.

This diagram helps visualize how data is stored and connected during the appointment booking process. It also confirms that the relationships defined in the class diagram work correctly at runtime.

3.3 Communication Diagram

The Communication Diagram illustrates the message flow and interactions between objects during the appointment booking process. It shows how the **Patient**, **Doctor**, and **Appointment** objects communicate and exchange messages in order to complete the booking.

This diagram focuses on the structure of the interaction and the order in which messages are passed, helping to better understand system behavior during runtime.

3.4 Timing Diagram

The Timing Diagram explains how the states of different objects change over time during the appointment booking process. It shows the timeline of events from when the patient selects a doctor to when the appointment is confirmed.
